Hudson County 2003 Open Space Survey

A note to the reader: In the fall of 2003 the Hudson County Office of Strategic Revitalization prepared a survey to guage voter support and preference for open space, recreation and historic preservation projects in Hudson County. The survey was mailed to over 33,000 households throughout the county. The office received back 433 completed surveys through February 2004. The office engaged the assistance of the New Jersey City University Mathematics Department to help interpret and understand the data. Below is an analysis of the survey followed by the actual results which have been cross tabulated by lifestyle and frequency by zip code. While the survey results are not scientific, they are meaningful in terms of public outreach and public participation for policy making.

Subject to the mathematical caveats discussed below, the survey indicates that a significant percentage (over 95%) of the respondents place high value the county's park and recreational facilities – fully 74.1% said it these facilities were "very important," and another 21.3% said they were "important." This result is not all that surprising when taking into account that a large percentage (84%) of those who responded reported that they not only used the county's park and recreational facilities within the past year, but did so quite regularly (with nearly half [46.7%] saying they used these facilities weekly, and another fifth [19.5%] saying they used them daily). The survey also showed similar support for the preservation of historically significant sites, with over 95% of the respondents stating that they either "strongly agreed" (75.1%) or "agreed" (22.2%) that such sites ought to be preserved for future generations.

In terms of the facilities and activities that should be available in the county recreational system, the numbers were fairly evenly distributed across the various choices offered in terms of sports activities (football, baseball, basketball, soccer, etc.) and indicated high levels of concern for each of them (the numbers for each showed over 70% of the respondents saying these facilities were "very important" or "important" to them). The strongest support, however, was seen in the non-athletic facilities. For instance, over 95% reported that open spaces, restrooms, playgrounds, and walking trails were either "very important" or "important" to them, and over 90% thought picnic areas were "very important" or "important." These numbers are surprising considering that Hudson is one of the most heavily developed and urbanized counties in the country. On the other hand, maybe it is precisely because these spaces are so rare in the county that they are valued so highly. It also might be a function of the methodological design flaws in the survey (discussed below).

As noted in the opening sentence, this survey was not a scientifically designed one and therefore interpreting the results comes with some caution flags. The main difficulty is that we

have no way of determining the margin of error of the results or the degree of confidence we have in the results. Let me explain.

In a scientific poll, we ask questions from a random sample of the target population and then extrapolate the results back to the target population as a whole. The key here is that we use "random" in a precise mathematical sense, which basically means that the respondents all have an equal and known probability of being included in the survey. Knowing that probability allows us to calculate the margin of error, which tells us how much the results obtained would likely differ from a survey of the entire target population. I suspect that the results of this survey would differ markedly from the county population as a whole for a couple of reasons.

As it was explained to me, the survey results were obtained from a mass mailing targeted to residents of Hudson County who voted in the previous 4 general elections. Given voter turnout in the county and what we know about the demographic differences between voters and nonvoters (voters tend to be older, better educated, and wealthier; and in some areas there are lingering gender and racial/ethnic differences as well; with more men than women voting, and more whites voting than minorities, particularly Hispanics), that decision significantly skewed the participants in the survey. Moreover, the survey asked respondents not only to complete the questionnaire but to provide their own postage. This dramatically skews the results you obtain; that is, you are likely going to hear from people who hold strong views on the issue (since those who don't care about it simply toss the survey in the recycle bin or otherwise fail to send it in. On 30 October 2003 we did a poll for the *Jersey Journal* and asked a question of Hudson's registered voters about the open spaces referendum, 16.7% said they had no opinion on the issue; and another 33.3% said they opposed the referendum). Given these two points, it is quite likely that the results of the survey here would differ dramatically from a more scientifically derived poll of the population in the county as a whole.

On the other hand, if the target population was the voting public – the people who actually turned out to express their opinions about the referendum issue – rather than the county as a whole, then the results may not be as suspect. The referendum passed overwhelmingly in an election with very low very turnout. Given the sample selection criteria used in the survey, there's a good chance that the people who responded to this survey comprised a significant portion of the turnout on the referendum, so that I'd be much more comfortable saying that the survey could indicate what the *voters* believe about the activities and issues covered in the referendum.
